PROFESSIONAL SUMMARY

Full-stack engineer who owns systems end-to-end — architecture, delivery, and production outcomes — for enterprise ERP and real-time platforms serving healthcare, education, and industrial clients. Track record: 50K+ users, 99.9% uptime, sub-200ms APIs, and 60–70% cuts in load time, billing errors, and manual overhead, across 6+ organizations and 15+ production releases in 3+ years. Deep in Angular, React/Next.js, Node.js/Express, and multi-tenant architecture with API-level RBAC. **AI-augmented by design:** Claude, GitHub Copilot/Codex, and Gemini are standing infrastructure in the daily workflow, not experiments — compounding delivery speed without trading off architectural rigor or code quality.

- **Architected multi-tenant systems live across 3 industries — 50K+ end users on shared infrastructure**
- **99.9% uptime and sub-200ms APIs sustained under real production load, not benchmarks**
- **60–70% cuts in load time, billing errors, and manual workflow across shipped systems**
- **AI-augmented daily driver: Claude, GitHub Copilot/Codex, Gemini, and agentic IDE workflows**

TECHNICAL SKILLS

Languages & Frontend: TypeScript, JavaScript, Angular, React, Next.js, RxJS, HTML5, CSS3, TailwindCSS

Backend & APIs: Node.js, Express.js, ASP.NET Framework, REST API Design, Node-RED

Databases: PostgreSQL, MongoDB, MySQL

Real-Time & Messaging: WebSocket, MQTT, RabbitMQ, Real-Time Dashboards, Pub/Sub Systems

Cloud & DevOps: AWS, Git, GitHub, CI/CD, Linux

Architecture & Security: System Design, Multi-Tenant Architecture, RBAC, Enterprise ERP Systems, API Design

AI-Augmented Engineering: Claude (agentic coding & code review), GitHub Copilot / Codex, Google Gemini, Antigravity (agentic IDE), Perplexity (technical research) — daily, pro-tier workflow

PROFESSIONAL EXPERIENCE

Full Stack Developer — Angular Specialist

Enterprise Software Team | 2023 – Present

- Owned architecture and delivery of a multi-tenant Hospital ERP now running across 3 facilities and 50K+ patient records, enforcing RBAC at the API layer to close a class of authorization bugs at the source
- Designed and led development of a real-time dashboard engine (WebSocket, MQTT, Node-RED, RabbitMQ) sustaining 99.9% uptime under continuous industrial device load
- Diagnosed and eliminated core dashboard performance bottlenecks — cut load time 65% via code-splitting and query optimization while sustaining sub-200ms API response at scale
- Redesigned the billing engine into a configurable, rule-driven system, cutting billing discrepancies 70% and removing a recurring source of customer escalations
- Drove adoption of AI-augmented engineering (Claude, GitHub Copilot/Codex) across code review, refactors, and architecture exploration, compressing delivery cycles without sacrificing quality

Full Stack Developer

Freelance / Contract Engineering | 2022 – 2023

- Owned end-to-end delivery of a School ERP for 1,200+ students across 3 role-based portals (admin, teacher, parent) on one shared codebase
- Redesigned attendance and fee workflows to be real-time and role-driven, cutting manual paperwork 90%
- Built and deployed production Node.js/Express REST APIs on AWS; designed schemas across MongoDB, PostgreSQL, and MySQL

SELECTED PROJECTS

Hospital ERP — Angular, Node.js, Express, PostgreSQL, REST APIs, RBAC

Multi-tenant hospital management platform: patient records, ward/bed management, billing engine. 3 facilities live, 50K+ patient records, <200ms core API response.

Dashboard Builder — React, Next.js, WebSocket, Node-RED, MQTT, RabbitMQ

Drag-and-drop, ThingsBoard-style real-time dashboard engine for industrial device data. 10K+ live data points/min, 99.9% uptime, zero data loss via durable queueing.

School ERP — Angular, Node.js, MongoDB, REST APIs, RBAC

Role-driven school management platform for attendance, fees, and parent communication. 1,200+ students, 90% less manual attendance paperwork.

ENGINEERING PHILOSOPHY

Every system above is designed around one question: what breaks first at 10x the users, data, or edge cases? Answering that early — not after an outage — is why these platforms run multi-tenant, real-time, and role-audited by design, not by patch. Self-directed path from data structures straight into production ownership.
